

## Statement of Purpose

After taking a break from employment only a few years after my graduation, I wish to continue my career in data.

My goal in my next job is to integrate an engineering team with already 1 or more senior data engineers.

I hope to, in the next 2-3 years, grow as much as possible in my profession and adopt the technical ability to become a senior data engineer.

My goal for my career in the next decade is to become proficient in building/scaling/managing large and complex data systems.

Ideally, in order to maximize personal growth, I would integrate a team that possesses a strong data / engineering culture as exemplified by, amongst other things, a bias towards:

- testing (software + data quality)
- version control / code reviews
- helpful technologies/ frameworks such as containerization, Iaas, etc..
- Other best practices in DataOps and DevOps
- mentorship towards junior devs in the context of data engineering

Currently while job searching I am keeping myself busy building things and reading books related to data. Most of what I am building/learning day to day is logged asynchronously on my github.

Thank you for your consideration.
